CAMS2_40 - Regional Air Quality production

Data streams:

- Near real time: forecasts (+96h) and analyses (-24h) for key air pollutants
- Reanalyses: interim daily (with a delay of a few weeks), validated (annually, with a delay of up to two years)
- Spatial resolution $0.1^\circ \times 0.1^\circ$

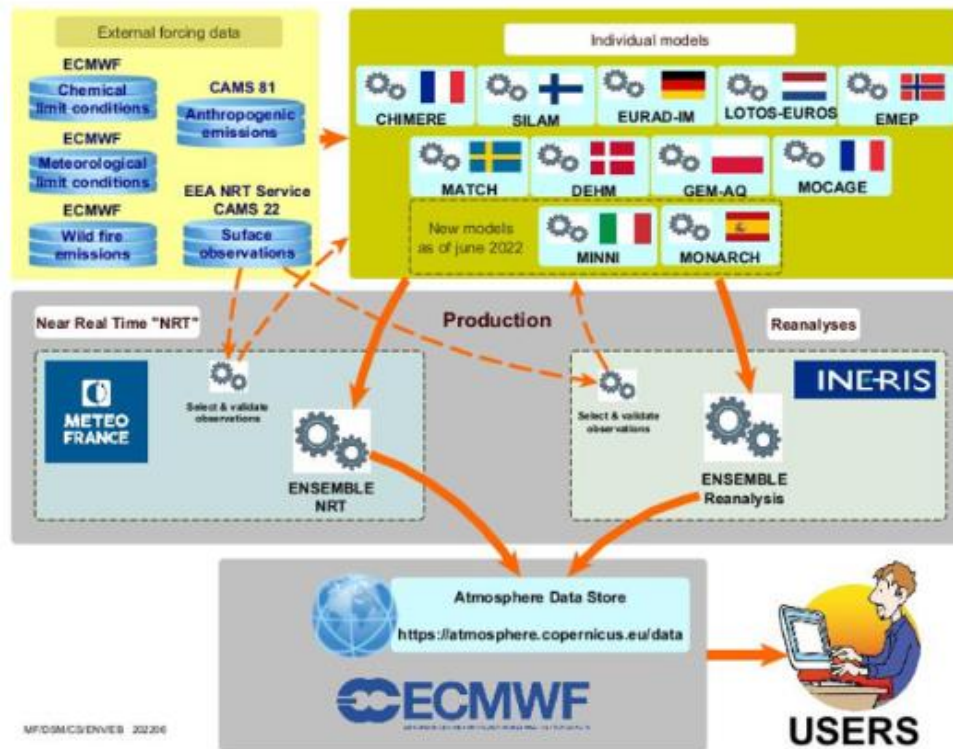

Wednesday 29 March 2023 00UTC CAMS Forecast +010 VT: Wednesday 29 March 2023 10UTC

Figure 2.17: Skill scores of the PM₁₀ analyses provided by the MINNI model, compared to the ENSEMBLE. Upper left: RMSE as a function of season (last 3 years); the orange line indicates the target performance. The other three panels show model performance as a function of analysis time (upper right: RMSE, lower left: MMB, lower right: temporal correlation). For each hour of the analysis, the median of all measurement stations is plotted. See the introduction to Section 2 for more information about the statistical parameters.

CAMS2_72IT - National Collaboration Programme (NCP)

Durata: 18 mesi (novembre 2022 - aprile 2024)

Obiettivo: utilizzo dei prodotti CAMS (uso diretto, downscaling qualità dell'aria, emissioni, ...)

Coordinamento: ISPRA

Partners: ENEA, ARPAE, ISAC-CNR, ARPA Lombardia, ARPAC, ARPAV, UNITOV

Budget totale: 150k€

Coinvolgimento ENEA (Massimo D'Isidoro et al.):

- **WP3:** Test del sistema FORAIR-IT con condizioni al contorno chimiche da CAMS-Regional (Ensemble o singoli), in coordinamento con i modelli CHIMBO (ISAC-CNR) e kAIROS (ARPAE-SNPA); successivi test di assimilazione dati superficiali.
- **WP4:** Armonizzazione inventario CAMS con inventario nazionale

H.EU CAMEO - CAMS EvOLution

Durata: 36 mesi (gennaio 2023 - dicembre 2025)

Obiettivo: acquisizione dati satellitari Sentinel-4, -5 e 3MI, metodi di assimilazione di aerosol e gas, metodi per incertezza per gli utenti dei prodotti CAMS

Coordinamento: ECMWF

Partners: 23

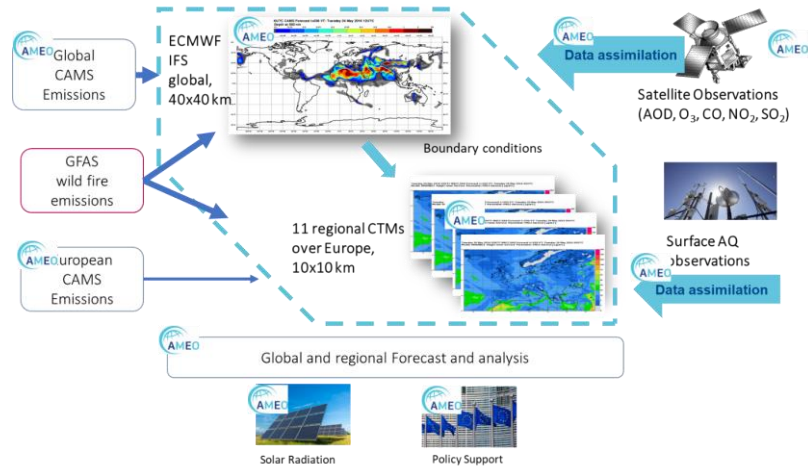

Budget totale (ENEA): 110k€

Coinvolgimento ENEA (Mario Adani et al.)

- **WP3:** Enhancement of Satellite Data Assimilation in regional CAMS models → innovare algoritmi di assimilazione già esistenti e produrre esperimenti numerici di assimilazione per gli inquinanti CO, O₃, SO₂ e CH₂O

<https://impatti.sostenibilita.enea.it/projects/cameo>

Ai fini della pianificazione della qualità dell'aria, quale lezione possiamo trarre da questo studio modellistico?

Nel periodo di simulazione (feb – mag 2020):

- la riduzione delle concentrazioni di NO_2 varia da 1 a $9 \mu\text{g}/\text{m}^3$ (3% - 30%), con maggiori riduzioni in area urbana;
- le concentrazioni di O_3 si riducono in area rurale e incrementano fino al 13% nelle aree urbane;
- il PM mostra riduzioni comprese tra 3 e $4 \mu\text{g}/\text{m}^3$ localizzate maggiormente nel bacino padano.

1. Gli effetti delle variazioni emissive sulle concentrazioni di inquinanti di natura secondaria (O_3) o con una importante componente secondaria (particolato) risultano particolarmente complessi.
2. Notevole attenzione deve essere prestata nella selezione di misure per contenere l'inquinamento atmosferico: interventi mirati in un unico settore non necessariamente portano alle riduzioni di concentrazione auspiccate.

Simulazione della qualità dell'aria in Italia durante il lockdown nel progetto Pulvirus
